Full frame data format description

Start character (1byte)	Address bit(1byte)	Byte length (1byte)	Command code (1byte)	Data bit (nbyte)	Sum check(2byte) cs1 cs2	Terminator (1byte)
0x68	adr	From command code to bytes checked	See command list	See command details (small end format)	From address to data sum check (small end format)	0x16

Supplementary description of data format:

1. Start character: 0x68, which is the start byte of a frame of data;
2. The address bit adr can be set through the menu or instruction, and the setting range is 1 ~ 254 (0xfe);The default address is 1 and the broadcast address is 0xff;
3. Byte length refers to the number of bytes from command code to check code (including check code);
4. Command code: different command codes correspond to different function instructions. See the table below for details;
5. Data bit: the returned data can be one byte or multiple bytes, and the data format is small end format.
Small end format: low byte comes first and high byte comes last; For example, when transmitting data 0x1234, first transmit low byte 0x34, and then transmit high byte 0x12;
6. Check is sum check, which is the sum from address bit to data bit, and the data format is small end format
For example, distance reading instruction: 68 ff 03 00 02 01 16, ff is the address code, 03 is the byte length,including 1 instruction code and 2 check bytes,0xff + 0x03 + 0x00 = 0x0102, the low byte comes first and the high byte comes last, cs1 = 0x02, cs2 = 0x01, 00 is the instruction code.
7. Terminator: 0x16, which is the end flag of one frame of data;
8. Both sending data and returning instructions meet the above instruction frame format;
Example of sending instruction: distance reading instruction: 68 ff 03 00 02 01 16
Resolution: 68 is the starting character and ff is the broadcast address code; 03 is the byte length, including 1 instruction code and 2 check bytes; 00 is the command code;02 01 is the check byte; 16 is the end code
Example of receiving instruction: distance return instruction: 68 00 05 00 0D 13 25 00 16
Resolution: 68 is the starting character and 00 is the default address code; 05 is the byte length, including 1 instruction code, 2 data bytes and 2 check bytes;0D 13 is the data byte, the small end format is converted into hexadecimal 0x130D, the corresponding decimal is 4877mm, and 25 00 is the sum check byte,The small end format is converted to hexadecimal as 0x0025 = 01 + 05 + 00 + 0D + 13; 16 is the end code;

完整帧数据格式说明

起始符(1byte)	地址位(1byte)	字节长度(1byte)	命令码(1byte)	数据位(nbyte)	和校验(2byte) cs1 cs2	结束符(1byte)
0x68	adr	从命令码到 校验的字节数	见命令列表	见命令详解 (小端格式)	从地址到数据的 和校验 (小端格式)	0x16

数据格式补充说明:

- 1.起始符:0x68,为一帧数据的起始字节;
- 2.地址位adr可通过菜单或者指令设定,可设定范围为1~254 (0xfe) ;默认地址为1,广播地址为0xff;
- 3.字节长度指的是从命令码到校验码的字节数 (含校验码) ;
- 4.命令码:不同命令码对应不同功能指令,详见下表;
- 5.数据位:返回数据可为1个字节,也可为多个字节,数据格式为小端格式

小端格式:低字节在前,高字节在后;例如数据0x1234,传递时先传递低字节0x34,再传递高字节0x12;

6.校验为和校验,从地址位到数据位的和,数据格式位小端格式

例如,距离读取指令:68 ff 03 00 02 01 16, ff为地址码,03为字节长度,包含1个指令码与2个校验字节,0xff+0x03+0x00=0x0102,传递时低字节在前,高字节在后,cs1=0x02, cs2=0x01,00为指令码。

7.结束符:0x16,为一帧数据的结束标志;

8.发送数据和返回指令均满足以上指令帧格式;

发送指令示例:距离读取指令:68 ff 03 00 02 01 16

解析:68为起始符,ff为广播地址码;03为字节长度,包含1个指令码与2个校验字节;00为命令码;02 01 为校验字节;16为结束码

接收指令示例:距离返回指令:68 00 05 00 0D 13 25 00 16

解析:68为起始符,00为默认地址码;05为字节长度,包含1个指令码,2个数据字节,2个校验字节;

0D 13为数据字节,小端格式转化为十六进制为0x130D,对应的十进制为4877mm,25 00 为和校验字节,小端格式转化为十六进制为0x0025 = 01+05+00+0D+13;16为结束码;
